Keri's **NXT-C Standard Light Proximity Card** provides maximum read range performance in a package considerably thinner than other "clamshell" proximity cards. It can be easily carried in a wallet or purse or worn on the clothing with a clip or necklace. These cards are extremely durable and convenient. They are manufactured with a vertical hanging slot punch, and they come with a lifetime warranty.

Keri's **NXT-I Multi Technology Card** allows the user to combine several identification technologies in a single credit card thin credential. The most popular feature of Multi Technology Cards is that they can accept a direct print video image - typically a photograph, bar code, or other user graphic - from most industry dye sublimation printers, to create a custom access credential.

Keri's **NXT-K Proximity Key Ring Tag** provides user convenience in a small, ergonomic, and extremely durable package. The tag is equipped with a brass eyelet for attachment to a key ring that ensures the neck of the tag will not break during the life of the system. Key tags are especially convenient for building entrances where the user still has their car keys in hand. If the system has many interior doors that are secured with a Keri access control system, users often attach the tag to a necklace for easy carrying, especially if the clothing does not have pockets.

Keri's **NXT-AP Adhesive Proximity Patch** offers all the flexibility of other Keri proximity credentials, but in a form factor that allows it to be attached to virtually anything. As with any Keri proximity device, it will read through most non-metallic surfaces. Attach it to a wallet or cell phone to create a personalized proximity credential, or use it with an existing photo ID card to create new security credentials without incurring the expense of rebadging. You can also place it on high value inventory items to uniquely identify these items to your security system.

All four Keri Proximity Credentials can be used interchangeably on the same system without worry about ID code duplication or format matching. Also, for security purposes, all NXT credentials use 128 bit encryption between card and reader.
